Acronyms

CA - Certification Authority

D-H - Diffie-Hellman

EE - End-Entity

IKA - Initial Authentication Key

KAK - Key Agreement Key

MAC - Message Authentication Code

OWF - One Way Function

PSE - Personal Security Environment

RA - Registration Authority

SECTION	FEATURE	STATUS	REMARKS
1	PKI MANAGEMENT OVERVIEW	0171100	
1.1	PKI Management Model		
1.2	Definitions of PKI Entities		
1.2.1	Subjects and End Entities	М	
	Personal Security Environment	М	
	Secure local access to	М	
	Own name	М	
	Own private key	M	
	Name of trusted CA	M	
	Trusted CA's public key	M	
	Other information	0	
1.2.2	Certification Authority	М	
1.2.3	Registration Authority	0	
1.3	PKI Management Requirements	М	
	Conformance to ISO 9594-8 standard and certificate	М	
	extensions	IVI	
	Conformance to other Internet PKI specifications	М	
	Key pair updating without affecting other key pairs	M	
	Minimal use of confidentiality	M	
	Support use of different cryptographic algorithms	M	
	Support key pair generation at EE	M	
	Support key pair generation at RA	M	
	Support key pair generation at CA	M	
	Key generation occurs wherever key is first presented	М	
	Support publication of certificates by EE	М	
	Support publication of certificates by RA	M	
	Support publication of certificates by CA	М	
	Support certified end-entities to request certificate revocation	М	
	Maintain level of protection from denial-of-service attacks	М	
	Usable over mail	М	
	Usable over http	М	
	Usable over TCP/IP	M	
	Usable over ftp	M	
	EE acceptance of certificates conforming to issuing CA's policy	М	
	RA acceptance of certificates conforming to issuing CA's policy	M	
	CA acceptance of certificates conforming to issuing	М	
	CA's policy Issuing CA hold publication of certificate pending	0	
	acceptance by requester		
	Scheduled, graceful CA key update	M	
	CA key compromised	C	
	All domain entities re-initialize EE accepts certificates verifiable with issuing CA's	М	
	old public key	М	

SECTION	FEATURE	STATUS	REMARKS
			Case: old CA public key
	EE accepts certificates issued under issuing CA's	M	is hardwired into EE's
	new private key		crypto equipment
	End-entities use the same protocol to communicate		CA may perform RA
	with RAs or CAs	M	duties.
	Maintain separate key pairs for RA and CA		
	functions	M	
	EE can obtain certificate containing a given public		
	key value after demonstrating possession of private	М	ref. 2.3
	key value		
	PKI Management Operations	М	
	CA establishment	М	ref. 4.1, 4.3
	EE initialization	M	ref. 2.1, 3.3.1, 3.3.2, 4.7
	Certification	M	101. 2.1, 0.0.1, 0.0.2, 4.7
	Initial registration/certification	M	ref. 2.2, 3.3.3, 3.3.4
	·	M	
	Key pair update		ref. 3.3.5, 3.3.6, 4.9
	Certificate update	M	ref. 4.8, Upon expiration
	CA key pair update	M	ref. 2.4, 3.3.13, 4.2
			ref. 3.3.11, 3.3.12, 4.6
	Cross-certification request	M	a.k.a. CA-certificate in
			X.509
	Subject CA distinct	M	
	Issuer CA distinct	M	
	SubjectPublicKeyInfo binds subject CA's	М	
	signing key pair		
	Mutual cross-certificates issued	0	
	Cross-certification update	M	ref. 4.8

	Cortificate publication	М	ref. PKIXLDAP, sec.
	Certificate publication	IVI	3.3.13-16
	CDL publication	N.4	ref. PKIXLDAP, sec.
	CRL publication	M	3.3.13-16, 4.4
	Recovery operations	M	EE has lost PSE
	Key pair recovery	M	ref. 3.3.7, 3.3.8
	CA backs up client key materials	0	,
	RA backs up client key materials	0	
	OR a key backup system associated with		
	a CA or RA	0	
	Protocol to exchange backed up key		
	materials	M	
	Revocation Operations	М	ref. 3.3.15
	Revocation request	M	ref. 3.3.9, 3.3.10
		IVI	PKIMessage
	PSE operations	M	(CertRepMessage)
	On-line implementation	0	(Certifepiviessage)
	Off-line implementation Off-line implementation	0	
	ASSUMPTIONS AND RESTRICTIONS		
2		M	
2.1	End Entity Initialization	M	
	Request information re PKI functions supported	M	
	Securely acquire a copy of the relevant root CA	М	
	public key(s)	1	

SECTION	FEATURE	STATUS	REMARKS
			Dependent on CA policies
2.2	Initial Registration/Certification	М	and EE type. EE has had no previous
			contact with PKI
2.2.1	Criteria Used	M	
2.2.1.1	Initiation of Registration/Certification	M	
	Occurs with generation of first PKI message related to EE	M	ref. 3.1
	Generated at CA	0	
	Generated at RA	0	
	Generated at EE	0	
2.2.1.2	End Entity Message Origin Authentication	0	Authentication of CA/RA messages achieved by use of their public key
	CA/RA authenticate received EE messages	0	
	Out-of-band distribution of initial authentication key and reference value	0	
	Out-of-band authentication	0	
2.2.1.3	Location of Key Generation		
	Generated with first occurrence in PKIMessage	М	ref. 3.1
	Generated at CA	0	
	Generated at RA	0	
	Generated at EE	0	
2.2.1.4	Confirmation of Successful Certification	0	Provides additional assurance
	EE confirms receipt of certificate by secure means	0	
2.2.2	Mandatory Schemes	М	
	Support of other schemas	0	
2.2.2.1	Centralized Scheme	0	
	Initiation occurs at certifying CA	M	ref. 2.2.1.1
	On-line message authentication	0	ref. 2.2.1.2
	Key generation occurs at certifying CA	M	ref. 2.2.1.3
	Confirmation message	0	ref. 2.2.1.4
	CA message to EE contains entire PSE	M	
	Out-of-band authentication by EE	M	
	Out-of-band provision of decryption key to EE	M	
2.2.2.2	Basic Authenticated Scheme	М	
	Initiation occurs at EE	M	ref. 2.2.1.1
	On-line message authentication	M	ref. 2.2.1.2
	Key generation occurs at EE	M	ref. 2.2.1.3
	Confirmation message	M	ref. 2.2.1.4
	RA/CA revokes issued certificate on confirmation failure	М	
	Out-of-band distribution of IAK from RA/CA to EE	M	
	Out-of-band distribution of reference value from RA/CA to EE	M	
2.3	Proof of Possession (POP) of Private Key	M	CA/RAs must confirm the EE's possession of a private key paired to the public key bound in the certificate
	Out-of-band procedures	0	
	In-band procedures	0	

SECTION	FEATURE	STATUS	REMARKS
	RA confirms verification of EE POP to CA	0	
	CA only permitted to verify EE POP	0	
	Different procedures for key types	М	
	Signature keys	М	ref. 2.3.1
	Encryption keys	М	ref. 2.3.2
	Key Agreement keys	М	ref. 2.3.3
	Multiple purpose keys	0	ref. 2.3.1, .2, .3
2.3.1	Signature Keys	М	, ,
	EE signs a value using its private key	0	
2.3.2	Encryption Keys	М	
	EE provides private key to CA/RA	0	
	EE decrypts value using private key	0	ref. 3.2.8
	Direct Method	0	
	EE immediately responds to random challenge from CA/RA	М	
	Indirect Method	0	RECOMMENDED
	CA issues a certificate encrypted by the EE's public key	М	CA issues a certificate which only intended EE can use
	EE proves its ability to decrypt the certificate in confirmation message	М	Returns decrypted certificate?
2.3.3	Key Agreement Keys	М	
	EE and CA/RA establish shared secret key	М	
	Encrypted exchange verifies POP	М	
	CA generates short-term key pair within parameters	С	
	CA certifies keys without restrictions	0	
2.4	Root CA Key Update	0	
	CA is root CA for some EE(s)	М	
	Certificates made available using X.500 directory	С	
	CA generates two additional cACertificate attributes	М	
	Protects new public key with old private key	М	Supports EE that acquire CA public keys via out-of-band means
	Protects old public key with new private key	М	EE can obtain old public key using new public key in order to decrypt what was encrypted with the old private key
	Support of version 1 certificates	М	
	X.509v3 extensions prohibited	М	
	Validity period of a CA key pair is greater than any certificate issued using that key pair	М	
	EE acquires new CA public key upon expiration of last certificate issued using old CA private key	М	Doesn't the EE get the new CA public key when the first certificate expires, not the last?

Out-of-band means Out-of-band means M M Dout-of-band means M M CA Operator Actions To change the CA key CA generates new key pair CA creates a certificate containing old public key signed with new private key (OldWithNew) Certificate validity period CA creates a certificate containing old public key signed with new private key (NedWithOld) Cat at the generation time of the old public key signed with old private key (NewWithOld) Cat creates a certificate containing new public key signed with old private key (NewWithOld) Cat creates a certificate containing new public key signed with old private key (NewWithOld) Cat fictal validity period Start at the generation time of the new key pair End when all the CA's EEs possess the new CA public key The expiration time of the old public key signed with new private key (NewWithNew) CA creates a certificate containing new public key signed with new private key (NewWithNew) The expiration time of the old public key signed with new private key (NewWithNew) CA creates a certificate containing new public key signed with new private key (NewWithNew) Cat creates a certificate containing new public key signed with new private key (NewWithNew) Cat creates a certificate containing new public key signed with new private key (NewWithNew) Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key signed with new private key (NewWithNew) M Cat creates a certificate containing new public key sign	SECTION	FEATURE	STATUS	REMARKS
To change the CA key CA generates new key pair CA creates a certificate containing old public key signed with new private key (OldWithNew) Certificate validity period Start at the generation time of the old key pair End at the expiration time of the old public key signed with old private key (NewWithOld) Certificate validity period M CA creates a certificate containing new public key signed with old private key (NewWithOld) Certificate validity period Start at the generation time of the new key pair End when all the CA's EEs possess the new CA public key The expiration time of the old public key at latest CA creates a certificate containing new public key at latest CA creates a certificate containing new public key at latest CA creates a certificate containing new public key signed with new private key (NewWithNew) Certificate validity period M Start at the generation time of the new key signed with new private key (NewWithNew) Certificate validity period M Start at the generation time of the new key pair End at the time of the next key update Publish certificates Via directory Via other means M Old CA private key is ne longer required.				requirement to mandate. 				Conflict with 2.4?
In-band means O Conflict with 2.4?				Conflict with 2.4?
2.4.2 Verifying Certificates M				
2.4.2.1 Verification in Cases 1, 4, 5 and 8	2.4.2.1		M	
Case 1: Repository contains NEW and OLD public keys		keys		
PSE Contains NEW public key &			&	
Signer's certificate is protected using NEW & public key		public key	&	
Signer's public key can be verified using verifier's local copy of the CA public key		Signer's public key can be verified using verifier's	М	
Case 4: Repository contains NEW and OLD public C keys		Case 4: Repository contains NEW and OLD public	С	
PŚE Contains OLD public key &			&	

SECTION	FEATURE	STATUS	REMARKS
	Signer's certificate is protected using OLD public key	&	
	Signer's public key can be verified using verifier's local copy of the CA public key	М	
	Case 5: Repository contains only OLD public key	С	Occurs if CA has issued both the signer's and verifier's certificates during the time between the generation of a new key pair and when the directory attributes are updated.
	PSE Contains NEW public key	&	
	Signer's certificate is protected using NEW public key	&	
	Signer's public key can be verified using verifier's local copy of the CA public key	М	
	Case 8: Repository contains only OLD public key	С	Occurs during the time between the generation of a new key pair and when the directory attributes are updated.
	PSE Contains OLD public key	&	
	Signer's certificate is protected using OLD public key	&	
	Signer's public key can be verified using verifier's local copy of the CA public key	М	
2.4.2.2	Verification in Case 2	М	Occurs when CA has issued signer's certificate then changed key and issued the verifier's certificate.
	Repository contains NEW and OLD public keys	С	
	PSE Contains NEW public key	&	
	Signer's certificate is protected using OLD public key	&	
	Verifier gets the CA's OLD public key to verify signer's certificate by	М	
	Obtaining OldWithNew certificate from the directory	М	
_	Determine based on validity periods	М	
	Use local copy of NEW CA public key to verify it	М	
	If verified, use OLD CA public key in certificate	М	
	Verification failure	0	UNSPECIFIED
2.4.2.3	Verification in Case 3	М	Occurs when CA has issued verifier's certificate then changed key and issued the signer's certificate.
	Repository contains NEW and OLD public keys	С	
	PSE Contains OLD public key	&	
	Signer's certificate is protected using NEW public key	&	
	Verifier gets the CA's NEW public key to verify signer's certificate by	М	

SECTION	FEATURE	STATUS	REMARKS
	Obtaining NewWithOld certificate from the	М	
	directory	IVI	
	Determine based on validity periods	М	
	Use local copy of OLD CA public key to verify it	М	
	If verified, use NEW CA public key in certificate	М	
	Verification failure	0	UNSPECIFIED
2.4.2.4	Failure of Verification in Case 6	М	Occurs when CA has issued the verifier's PSE containing new key without updating the directory attributes. Verifier has no means to get trustworthy copy of CA's old public key. CA held at fault.
	Repository contains only OLD public key	С	
	PSE Contains NEW public key	&	
	Signer's certificate is protected using OLD public key	&	
	Verification failure	М	
2.4.2.5	Failure of Verification in Case 7	М	Occurs when CA has issued the signer's certificate protected with the new key without updating the directory attributes. Verifier has no means to get trustworthy copy of CA's new public key. CA held at fault.
	Repository contains only OLD public key	С	
	PSE Contains OLD public key	&	
	Signer's certificate is protected using NEW public key	&	
	Verification failure	М	
2.4.3	Revocation – Change of CA Key	М	Change of keys also impact revocation checks. CA may sign CRL with a newer key than found in EE's PSE
	Verification in Cases 1	М	ref. 2.4.2.1
	Verification in Cases 2	М	ref. 2.4.2.2
	Verification in Cases 3	М	ref. 2.4.2.3
	Verification in Cases 4	М	ref. 2.4.2.1
	Verification in Cases 5	М	ref. 2.4.2.1
	Failure of Verification in Case 6	М	ref. 2.4.2.4
	Failure of Verification in Case 7	M	ref. 2.4.2.5

3	DATA STRUCTURES	М	For PKI management messages
3.1	Overall PKI Messages	М	
	SEQUENCE	М	
	header PKIHeader	М	ref. 3.1.1 Common information
	body PKIBody	М	ref. 3.1.2 Message specific information

SECTION	FEATURE	STATUS	REMARKS
	protection [0] PKIProtection	0	ref. 3.1.3 Contains bits that protect the PKI message.
	extraCerts [1] SEQUENCE SIZE of Certificate	0	Certificates of possible use to the recipient
3.1.1	PKI Message Header	М	Addressing and transaction identification
	SEQUENCE	М	
	pvno INTEGER (1)	М	Fixed at one for this specification version
	sender GeneralName	М	ref. PKIX1, sec. 4.2.1.7 Sender's name, usable to verify the message's protection.
	NULL field when sending entity knows nothing about the sender	М	Entity may not know its own DN, etc. NULL field is a SEQUENCE OF RDNs of zero length.
	senderKID field present	М	Provide a reference to the receiver that indicates the appropriate shared secret information that verifies the message
	recipeint GeneralName	М	ref. PKIX1, sec. 4.2.1.7 Recipient's name, usable to verify the message's protection.
	messageTime [0] GeneralizedTime	0	Time sender created the message. Meaningful on reception?
	protectionAlg [1] AlgorithmIdentifier	0	Specifies the algorithm use to protect the message
	Omit when PKIProtection not supplied	М	
	Supply when PKIProtection supplied	М	
	senderKID [2] Keyldentifier	0	Indicates keys used to protect message
	recipKID [3] Keyldentifier	0	Indicates keys used to protect message
	This field only present if D-H keys protect the message	М	
	transactionID [4] OCTET STRING	М	The same in corresponding request, response and confirmation messages.
	senderNonce [5] OCTET STRING	0	Protects against replay attacks. Inserted by sender.
	recipNonce [6] OCTET STRING	0	Protects against replay attacks. Nonce previously inserted in a related message by the intended recipient.

SECTION	FEATURE	STATUS	REMARKS
	freeText [7] PKIFreeText	0	Use to send human- readable message to recipient in any language.
	SEQUENCE SIZE OF UTF8String	М	First language used in the sequence indicates language for replies.
	generalInfor [8] SEQUNCE SIZE OF InfoTypeAndValue	0	Use to send additional machine-proccessable data
3.1.2	PKI Message Body		Message-specific body elements
	CHOICE	М	ref. 3.3
	ir [0] CertReqMessages	0	Initialization Request, ref. 3.3.1

	OWF ("n" BASEKEY) used for H's next MSB	М	Continued until all K bits have been derived.
	Sender possesses a signature key pair	0	
	PKIProtection contains signature value	M	
	protectionAlg is AlgorithimIdentifier for a digital signature	М	ref. PKIX1, sec. 7.2
	Multiple protection	0	
	NestedMessageContent ::= PKIMessage	М	Entire message sent within new PKI message.
3.2	Common Data Structures	M	Used in PKIBody
3.2.1	Requested Certificate Contents	М	ref. CRMF for syntax. A data structure to specify the certificate content.
	Message originator indicates some fields it wishes present in the certificate being issued to it.	М	
	CA has discretion over fields included in the certificate regardless of originators request	М	
3.2.2	Encrypted Values		ref. CRMF for syntax. A data structure to send encrypted values in PKI messages.
	Use when PKI message contains private key	М	
	Use when PKI message contains certificate	M	
	Sender and receiver can encrypt/decrypt	M	
	Sender and receiver have or can generate a shared secret key	0	
	Receiver has private key for decryption	С	
	encSymmKey contains session key encrypted with receiver's public key	0	

SECTION	FEATURE	STATUS	REMARKS
3.2.3	Status Codes and Failure Information for PKI Messages	М	A data structure that provides status information in the response messages.
	PKIStatusInfo ::= SEQUENCE	M	
	status PKIStatus	M	
	PKIStatus ::= INTEGER	M	
	granted (0)	0	Requester gets exactly what they asked for
	grantedWithMods (1)	0	Requester gets something like what they asked for. They are responsible for ascertaining the differences
	rejection (2)	0	Request denied. More information elsewhere in the message.
	waiting (3)	0	The request body part has not yet been processed, expect to hear more later.
	revocationWarning (4)	0	This message contains a warning that a revocation is imminent.
	revocationNotification (5)	0	A revocation has occurred.
	keyUpdateWarning (6)	0	Update already done for the oldCertId specified in the key update request message
	statusString PKIFreeText	0	ref. 3.1.1
	failInfo PKIFailureInfo	0	Additional information providing reason for failure.
	PKIFailureInfo ::= BIT STRING	М	
	badAlg (0)	0	Unrecognized or unsupported Algorithm Identifier.
	badMessageCheck (1)	0	Integrity check failed (e.g., signature did not verify).
	badRequest (2)	0	Transaction not permitted or supported.
	badTime (3)	0	messageTime was not sufficiently close to the system time, as defined by local policy.
	badCertId (4)	0	No certificate could be found matching the provided criteria.
	badDataFormat (5)	0	The data submitted has the wrong format.
	wrongAuthority (6)	0	The authority indicated in the request is different from the one creating the response token.

SECTION	FEATURE	STATUS	REMARKS
	incorrectData (7)	0	The requester's data is incorrect (used for notary services).
	missingTimeStamp (8)	0	When the timestamp is missing but should be there (by policy).
3.2.4	Certificate Identification	М	ref. CRMF for syntax. A data structure that provides the identification of particular certificates.
3.2.5	"Out-of-Band" Root CA Public Key	М	A data structure to support out-of-band distribution of current root CA public key.
	Root CA directly distributes its self-signed certificate out-of-band	0	
	OOBCert ::= Certificate	М	ref. PKIX1, sec. 4
	Signature field verified by use of SubjectPublicKeyInfo field	М	Self-signed certificate
	Subject and Issuer field are identical	М	
	Subject field NULL	0	
	subjectAltNames and issuerAltNames extensions are present and identical	М	
	Key identifiers for subject and issuer are identical	М	
	All other extensions are suitable to self- signed certificate	М	keyCertSign bit of Key Usage extension? Others?
	Root CA makes its self-signed certificate available on-line and distributes a hash of it out-of-band	0	Anyone who has securely received the hash value can verify the on-line self-signed certificate.
	OOBCertHash ::= SEQUENCE	М	
	hashAlg [0] AlgorithmIdentifier	0	
	certId [1] CertId	0	ref. CRMF for syntax
	hashVal BIT STRING	М	Calculated over the self- signed certificate with the identifier certID.
3.2.6	Archive Options	0	ref. CRMF for syntax. A data structure to request the PKI to archive a private key value.
3.2.7	Publication Information	0	ref. CRMF for syntax. A data structure to request the PKI to publish a certificate.
3.2.8	Proof of Possession Structures	0	ref. CRMF for syntax. A data structure used to demonstrate possession of a private key.
	Certification request for a signing key pair	0	A verification certificate
	POPOSigningKeyInput ::= SEQUENCE	M	
	authInfo CHOICE	M	
	sender [0] GeneralName	0	ref. PKIX1, sec. 4.2.1.7
